

ECC → S/4 HANA

Accounts Receivable Migration Validation Report

ECC Source	ECC_AR_20260930_154206.xlsx
S/4 Target	AR_S4_Load_20260930_154224.xlsx
Overall Status	PASS
Validation Checks	4 passed / 0 failed / 4 total

OVERALL RESULT: PASS

Executive Summary

The Accounts Receivable migration validation completed successfully. All configured reconciliation checks passed based on the results returned by the validation engine.

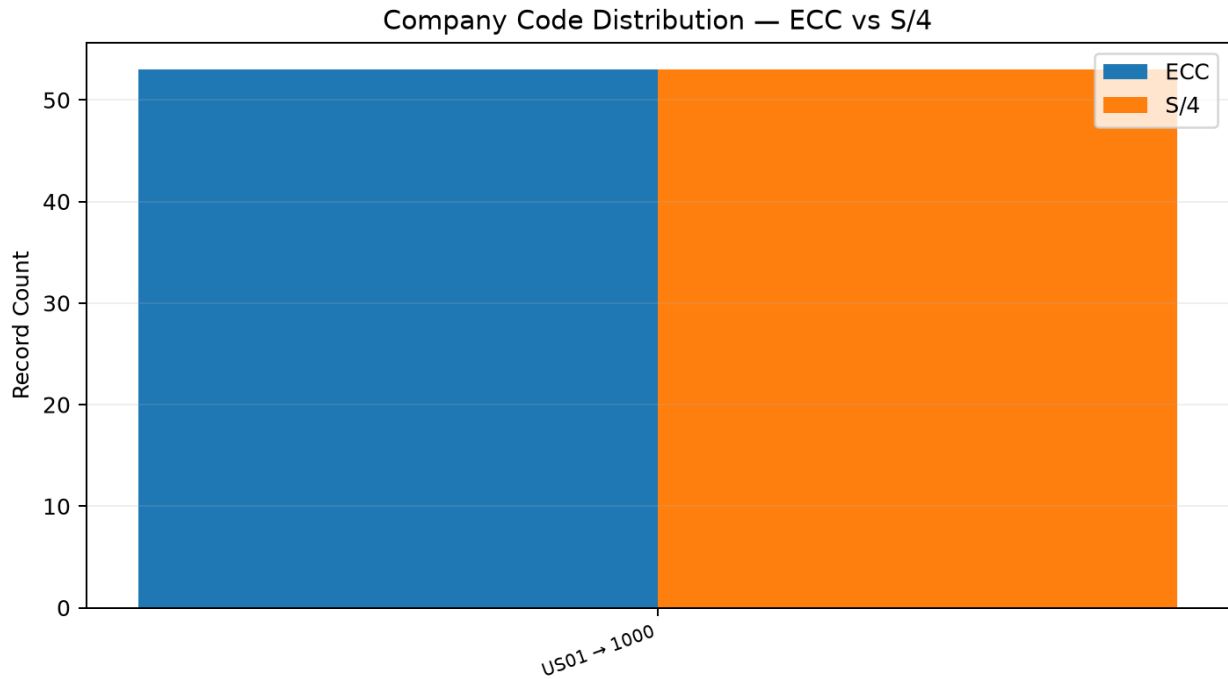

Report Scope

This report documents the validation checks performed by the Accounts Receivable migration validator. Numerical values, statuses, mappings, and reconciliation results shown in the report are taken directly from the validator payload.

1. Company Code Distribution

This validation compares the distribution of records by company code. Each ECC company code is evaluated against its configured S/4 company code mapping, and the corresponding record populations are compared.

ECC Company Code	S/4 Company Code	ECC Records	S/4 Records	Difference	Result
US01	1000	53	53	0	PASS

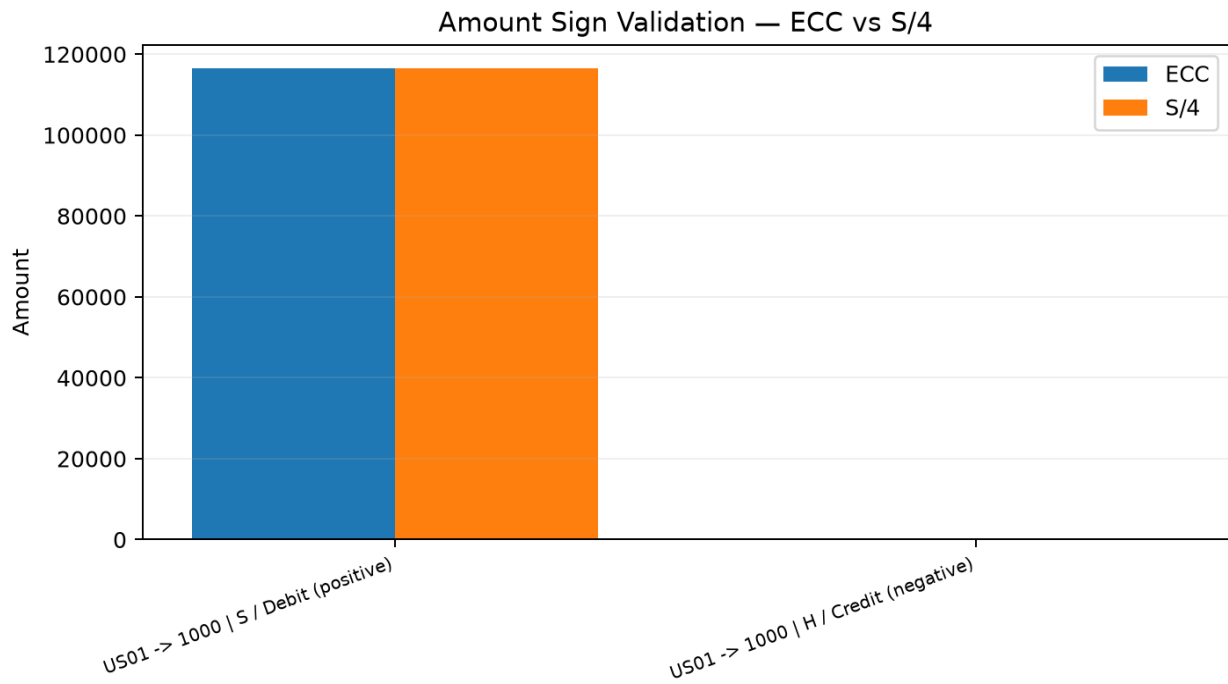

All company code counts match.

2. Amount Sign Validation

This validation checks whether ECC debit and credit indicators are represented with the expected positive and negative amount signs in the S/4 WRBTR field.

Category	ECC Amount	S/4 Amount	Difference	Result
US01 -> 1000 S / Debit (positive)	116,493.00	116,493.00	0.00	PASS
US01 -> 1000 H / Credit (negative)	0.00	0.00	0.00	PASS

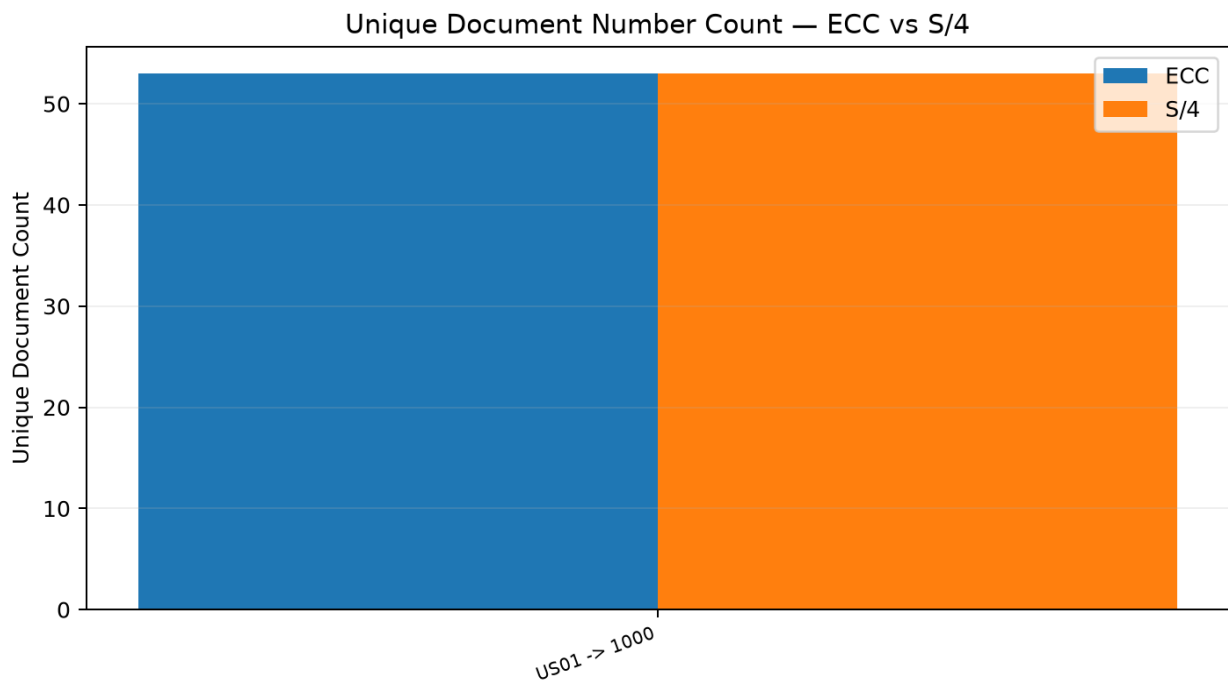

ECC S/H amount totals match S/4 positive/negative WRBTR totals for every company code.

3. Unique Document Number Count

For each company code, this check compares the number of distinct ECC Document Numbers against the number of distinct S/4 XREF1 values (Reference Key 1), which the migration populates from the ECC Document Number. Matching counts mean every unique ECC document survived the migration exactly once per company code.

ECC Company Code	S/4 Company Code	ECC Unique Documents	S/4 Unique XREF1	Difference	Result
US01	1000	53	53	0	PASS

Unique ECC Document Number counts match unique S/4 XREF1 counts for every company code.

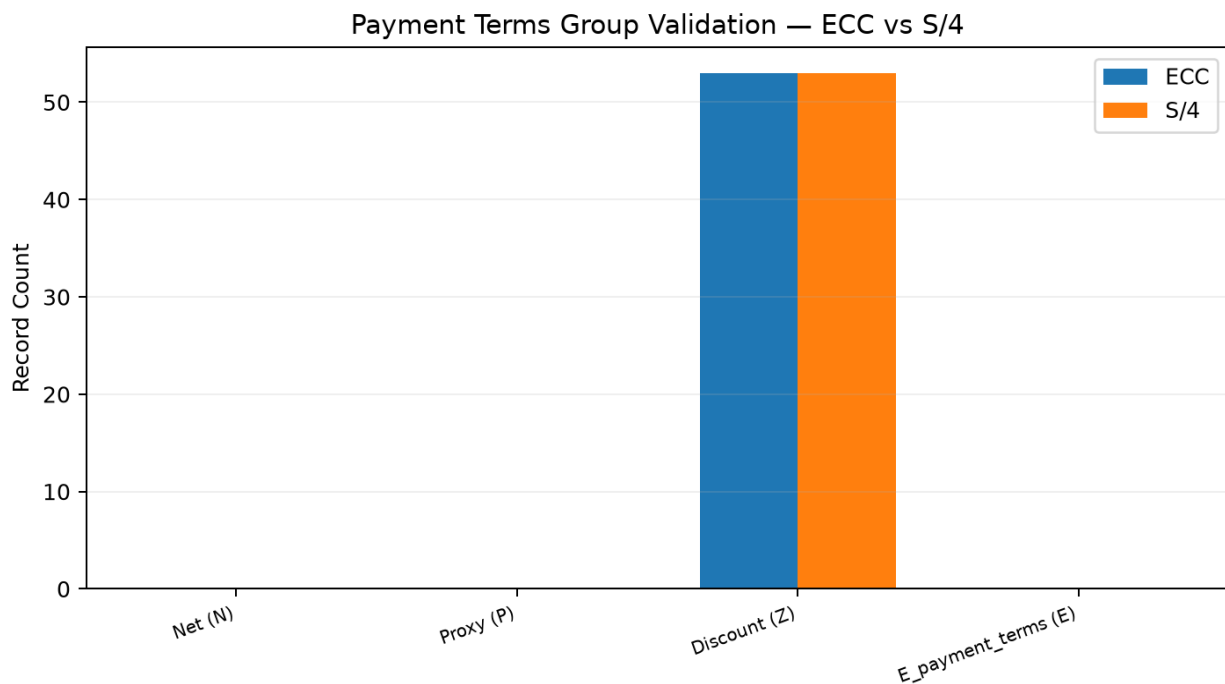

4. Payment Terms Group Validation

Payment terms are validated using configured groups. Each ECC payment term belongs to a group whose corresponding S/4 payment terms form the target group. Multiple ECC terms mapping to the same S/4 term remain together in the same group. The validator compares the total record count for each group rather than treating every mapping as a separate top-level validation.

Configured Payment-Term Sets

The following table shows the exact ECC and S/4 payment-term membership used by the validator. These mappings are displayed from the validator payload and are not generated by the LLM.

Group	ECC Count	S/4 Count	Difference	Result
Net (N)	0	0	0	PASS
Proxy (P)	0	0	0	PASS
Discount (Z)	53	53	0	PASS
E_payment_terms (E)	0	0	0	PASS

All payment term groups (N, P, Z, E) have matching counts.

Final Conclusion

The validation results indicate that the configured reconciliation criteria were satisfied for the supplied ECC source and S/4 target files.

Validation	Status
Company Code Distribution	PASS
Amount Sign Validation	PASS
Unique Document Number Count	PASS
Payment Terms Group Count	PASS
